HH Medical Staff

Provider Update: September 2026

Good afternoon,

Here are this month's updates for HH providers. Full details are in the HH Medical Staff Newsletter.

ARROW update: two high-volume pop-up alerts scaled back

The Alerts/Rules Review & Optimization Workgroup (ARROW) is removing two of the most voluminous pop-ups for most Cerner positions.

- **Latex Allergy pop-up** moves to a passive SmartZone alert for most users. It continues for non-physician staff in peri-op areas, cath lab, and pharmacy.
- **Renal Function pop-up** on radiology orders is discontinued; it has not proven as valuable as anticipated.

Wound photography: always include a size reference

A best-practice reminder for anyone documenting wounds with photos.

- Without a size reference, a photo has no scale. Camera distance and angle change apparent size from shot to shot.
- Place a sterile gauze square or paper measuring guide in the frame so reviewers can judge true size and track change over time.
- Photos support written measurements; they do not replace charting length, width, depth, and tissue characteristics.

Correct: sterile gauze square for scale

Incorrect: a banana is not a size reference

Bladder training / catheter clamping: skip it before Foley removal

Evidence brief on a practice that is still common but not supported by the data.

- Clamping short-term indwelling catheters (≤7 days) before removal offers no benefit and is associated with higher UTI risk and longer time to first void.
- Remove the catheter promptly once no longer needed, using passive balloon deflation.
- Follow with a voiding trial: expect a spontaneous void within ~6 hours and check post-void residual by bladder ultrasound.

Outpatient tube feed ordering: provider quick guide

A 4-step workflow and role breakdown for ordering home enteral nutrition.

- **Consult early:** place the inpatient RD consult as soon as home tube feeding looks likely, so recommendations are ready before discharge.
- **Roles:** RD recommends formula/regimen; provider reviews, completes, and signs the order; Case Management/Social Work coordinates vendor, payer, and equipment.
- **Before discharge, confirm:** RD consult is done, documentation supports the need, and the signed order is with Case Management/Social Work.
